

Our extensive remarketing program provides the facilities and expertise to ensure you recover the maximum value possible from your electronic waste.

Remarketing

Based on comprehensive evaluation of your goals and equipment, we tailor the recovery process to provide the greatest return, starting with remarketing and providing additional processing through appropriate Sims Recycling Solutions services. In addition, we capture detailed information that assists in reconciling inventory records while ensuring the security of confidential information and licensed data.

Inventory, Tracking, & Data Capture

Sims Recycling Solutions inventories and bar codes all electronic assets with a unique tracking number, which allows equipment to be followed throughout the recovery process. Sims Recycling Solutions identifies and records basic asset information such as serial numbers, manufacturer and model numbers, as well as completes a more in-depth diagnostic audit. This audit identifies the functionality, completeness, and technology level of all components, which enables our resale staff to maximize your return.

Data Security

Sims Recycling Solutions eliminates the risk involved with data security. In preparation for computer remarketing, all hard drives and other memory storage systems are overwritten following NIST SP 800-88, Guidelines for Media Sanitization to prevent unauthorized access of proprietary information. Our professional staff can provide comprehensive reporting to comply with all customer data security and destruction requirements.

Testing & Remarketing

As an established leader in the field of remarketing, we pride ourselves on our solid industry reputation. Our proficient technicians review each item, carefully identifying those that still have remarketable value. Remarketable equipment is cleaned, tested, and upgraded as necessary. Items that cannot be remarketed proceed to the next level of asset management.
